

# **WELCOME To the Gridline Transmuter Sculpt tool!**

This tool will help you create  
a better biofield energy  
around your land.

The Human body has veins  
of biofield energy which  
circulate energy qualities  
through the human body  
called meridians in  
Traditional Chinese  
Medicine. The Earth has a  
similar network of meridians  
called Gridlines. These

Gridlines carry Energy qualities over many miles and help the living earth function. If these energy qualities become polluted from Electricity or other issues, The resulting energy qualities become contaminated and will negatively affect life.

There exists a biofield combination which is able to transmute these unhealthy energy energy qualities into

a universally beneficial energy quality. This life supporting biofield is created in the center of every circle, as well as the ratio of 16:19 . This tool creates this biofield above the curves.

## **How to Use:**

Find a CNC cutting service, online or in person. Send them this DXF file. Request the shape be cut out of 1/2 inch polycarbonate.

(Polycarbonate is very strong). Once you have the shape, set aside for future use.

Learn How to create COB.  
An earthen building material made from clay sand straw and water.

On the border of your land, create a log of cob material. While the COB is still pliable, hold the sculpt tool with the flat side against your hands,

and scrape the curved side along the top of the cob. Creating the pattern along the length of the log. Do not stamp the pattern in, but scrape the pattern along the surface.

Once this shape is made all the grid lines running under this cob log will be transmuted to the Universal Beneficial Biofield. And the grid lines will carry that beneficial quality for miles

along that line.

Since lines can run in many directions, you can use a dowser who knows radiesthesia to find the lines for you, Or you can make a "biofield moat" around the entire perimeter of your land using the cob logs, which when joined will look like one long log.

Once cob dries it can last for hundreds of years in the right

climates.

Enjoy and please share this wonderful tool.
